

Build an AI feature that gives time back.

Identify a real productivity bottleneck in a CRM operation and design the AI feature that solves it — end-to-end.

About Superleap

Superleap is the **AI-native CRM for modern enterprise teams** — built to replace legacy stacks like Salesforce and HubSpot, along with the 8–12 tools wrapped around them. We work with revenue teams across Education, Healthcare, BFSI, Real Estate, and Automotive, and we're trusted by businesses like Razorpay, Cars24, Aakash, Cuemath, and MediBuddy.

The Landscape

The CRM world broadly splits into two sectors. Each runs very different day-to-day operations.

B2B

e.g. Razorpay

B2C

e.g. Policy Bazaar, UpGrad, Unacademy

EXAMPLE INDUSTRIES (NOT EXHAUSTIVE)

Insurance / InsureTech

Healthcare / HealthTech

Education / EdTech

Automotive

Just examples to anchor your thinking. Feel free to pick **any industry** with a meaningful CRM operation — what matters is the depth of insight and the quality of the AI feature you propose.

The Assignment

Pick **one sector (B2B or B2C)** and **one industry**. Then build an **end-to-end product feature proposal** — an AI-powered feature inside our CRM that solves a real operational pain point. We want the full product thinking: from customer problem, to the AI feature you'd build inside Superleap, to how it would actually look and behave for a real user.

The goal of the feature: **increase the productivity of the end user** — sales rep, agent, counsellor, support exec — by cutting low-value work so they can focus on what drives revenue.

ILLUSTRATIVE EXAMPLE

In **EdTech (B2C)**, inbound lead velocity is high — ~5,000–6,000 leads/day. A counsellor's 8-hour day splits roughly into 3–4 hours of calling and 3–4 hours of admin (forms, call notes, dispositions). That admin time is a direct tax on productivity.

An AI feature could analyse the call in real time and auto-fill the relevant fields. Saving even 30–60 minutes per counsellor per day means **10–15 additional leads called daily** — directly moving conversions and revenue.

Just one example. Find your own problem in the industry you pick.

| What to Submit

A single prototype that covers all four parts of the proposal:

1 Research

A clear view of the industry and sector you picked — how its CRM operations work day-to-day, who the end users are, and what their workflows actually look like.

2 Problem Statement

The specific pain point you've identified — backed by data, observations, or reasoning about how much time and effort it costs the team today.

3 Proposed Solution

The AI feature you'd build inside Superleap — how it works, what data it uses, and how it fits the user's workflow. Think end-to-end: **feature naming, branding & theming, GTM strategy, and (if possible) a rough cost structure**. We want a PM who can ship a feature, not just spec one.

4 Prototype

A working, clickable prototype showing the feature in live action. The closer to a real user flow, the better — we should be able to click through and feel how it would behave inside the CRM.

| Format & Submission

Submit a **prototype link** — a working, clickable prototype we can interact with. The prototype itself should carry the research, problem statement, proposed solution, and the feature in action.

TURNAROUND

3 days from receiving this assignment
